Preface	6
Foreword.....	7
1. Introduction	9
1.1. Subject of rock mass mechanics	9
1.2. Mechanical and rheological properties of rocks	11
1.3. Strength hypotheses	21
2. Primary state of stress in rocks	31
2.1. Influence of gravity force	31
2.2. Influence of tectonic forces	34
3. State of tension in a rock mass in the vicinity of dog headings	36
3.1. Lamé's problem	36
3.2. Elastic systems	41
3.2.1. General remarks	41
3.2.2. Working of the circular cross-section	42
3.2.3. Working of rectangular intersection.....	51
3.2.4. Working of elliptic intersection.....	55
3.2.5. Theory of pressure arch	57
3.2.6. Heading working in heterogeneous rock mass	59
3.3. Elastic-plastic-viscous systems	61
3.3.1. Circular working	61
3.4. Elastic system with the fracture region	66
3.4.1. Equilibrium of loose and coherent media	66
3.4.2. Hypothesis of effort for brittle materials	71
3.4.3. State of stresses in the neighbourhood of a circular working in fractured rock mass	71
4. Pressure of rocks on a working lining	76
4.1. Preliminary remarks. Static pressure	76
4.1.1. Protodiakonov's theory	76

4.1.2. Cymbariewicz' theory	79
4.1.3. Bierbaumer's theory	79
4.2. Deformation pressure (Sałustowicz)	81
4.2.1. Kelvin's medium	82
4.2.2. Maxwell's medium	88
4.2.3. Other media	90
4.2.4. Plastic and loose media	90
4.3. Calculation of the lining at roof pressure	93
4.4. Calculation of the lining vault	94
4.5. Calculation of the lining of elliptic shape	97
5. Pressure of the rock mass on the shaft lining	102
5.1. State of tension in rocks in the neighbourhood of shafts	102
5.2. Pressure on the shaft lining in a loose medium	103
5.3. Pressure on the shaft lining in the plastic rock mass	105
6. State of tension in the rock mass	
in the neighbourhood of mining workings	108
6.1. General remarks on excavation of deposits	108
6.2. Classification of roof rocks	109
6.3. Theory of pressure wave	110
6.4. Excavation with filling	116
6.5. Distribution of stresses in the excavated seam	127
6.6. Selection of the excavation system depending	
on properties of roof rocks	129
6.7. General characteristic of tension state	
in the rock mass at an excavation of deposits	131
6.8. Cooperation of lining with rock mass in an excavation working	133
6.9. Cleavage and its meaning for mining of rocks	134
7. Magnitude and rock mass pressure distribution in seam leftovers	137
7.1. Distribution of pressure in pillar	137
7.2. Strength of pillars	140
7.3. Excavation of salt deposits	142
7.4. Calculating the width of pillar between two workings	
in the undisturbed rock mass	145
7.4.1. First method	146
7.4.2. Second method	149
7.5. State of tension in the rock mass below or above left pillars	151
7.6. Interaction of simultaneous exploitation of several seams	157
8. Bumps	159
8.1. Nature of bumps	159
8.2. Occurrence of bumps	159

8.3. Bumps in the light of rheological investigations	162
8.4. Prevention of bumps	164
9. Influence of mining workings on the terrain surface	166
9.1. General features of the excavation influence on surface	166
9.2. Influence of heading works	168
9.3. Displacements of the points at terrain surface above the edge of excavated seam	172
9.4. Inclination of terrain	175
9.5. Curvature of the profile of subsidence trough	175
9.6. Specific horizontal strains	177
9.7. Course of the surface point subsidence in time	179
9.8. Determination of the subsidence velocity coefficient	182
9.9. Influence of velocity of deposit extraction	183
9.10. Decreasing the influences of underground excavation on the surface	184
9.11. Leaving the protecting pillars	184
9.12. The smallest dimensions of protecting pillar	186
9.13. Determination of protecting pillars on the basis of admissible magnitude of terrain deformation	187
Appendix. Guidelines of determining protecting pillars for objects, installations and terrains within the hard coal mining area of the Upper Silesian and Lower Silesian Basin	189
